

Abstrac

Currently or newspapers are very rarely found around us, because some people prefer to read news through the internet, one of which is through websites, according to data taken through Aseanup.com stating that Indonesia is a mobile first internet access country by 61% and 39% via laptop or computer. Indonesia is also recorded to have a high number of social media usage, which is 540 minutes per day. In addition, social media consumption on devices reaches 291 minutes. However, there are obstacles in terms of accessing a news, namely that people have to open news websites one by one that they want to read inefficiently. Therefore, the author builds a web content generator to make it easier for readers to find the news they want so that readers don't have to open website news one by one. In this study, the author uses Rest (Representational State Transfer) to retrieve data from news websites which will then be connected to the news generator website. In addition, the author also uses a Search Engine method where readers can find anything through Search Engines using keywords from the desired news topic.

Keywords : Web News, Web Content Generator, Rest (Representantional State Transfer)
