

ABSTRACT

In Indonesia, there are many street children who lack education, are neglected on the streets, so it is very likely that children's growth and development will not be good. Many people want to prosper the shelter but are confused about how to distribute the donation funds. Donors do not have access to see whether the donations given have been delivered correctly or not. This final project aims to help the public and donors know about the Shelter House in Indonesia, increasing the efficiency of donors to donate. This website-based donation system is made with the Codeigniter framework, the PHP programming language, and the MySQL database as data storage media. Therefore, to overcome the existing problems, it is necessary to have a new media, namely a website-based online donation media which is expected to be able to help shelter homes in managing donations for street children.

Keywords: *street children, halfway houses, websites, donations, donors.*
