

ABSTRACT

In the distribution of subsidized fuel, it often happens that the distribution of fuel is not right on target, this has an impact on fuel at gas stations running out quickly and people who should get subsidized fuel do not get any. Therefore, the implementation of a fuel card application was made which functions to verify and record the registration of members who are entitled to receive fuel subsidies. With the implementation of the fuel card application, it can reduce the distribution of fuel that is not on target so that consumers who will buy fuel can be controlled, who buys subsidized fuel and can limit the amount of subsidized fuel use for vehicles because of the quota of liters per day. In this case, the purpose of making a fuel card application is to record the manufacturing process, verification, data injection, delivery of fuel cards, and subsidized fuel quotas that are distributed to entrepreneurs, especially for truck drivers so that they get fuel evenly and in accordance with the amount of the fuel quota. burn per day. The Fuel Card application is a website-based application using the CodeIgniter framework.
