

ABSTRACT

Existing café facilities at this time haven't paid attention to the needs of visitors. Chairs which are part of café interior furniture can't be used optimally due to luggage such as bags placed on chairs. For this reason, there was a redesign of a multifunctional bar stool type chair to support the productivity and needs of café visitors. To get a target where this multifunctional bar stool can be used at a café located in Bandung with the name Level Six Café & Bar which has a user level with activities not only drinking coffee or eating existing dishes, but doing other activities such as holding small meetings, discussing, doing assignments, and also visitors who come tend to take a lot of pictures with instagramable spots which are the main concept of the café. For this reason, the author designed a bar stool with multifunctional adjustments to support the needs of user activities using descriptive qualitative methods, such as observations and questionnaires to obtain valid data and also study literature as a complement to the required data and theory..
