ABSTRACT

At this time, posyandu has an important role to support health services for the community, including those who are included in the elderly group. The government has also begun to pay attention to the importance of the health of the elderly by holding many activities specifically to improve the health of the elderly. However, the activities carried out at the posyandu are still carried out manually, either screening or providing information on posyandu activities.

So to overcome this problem in this final project an application is made that can facilitate users and cadres in carrying out activities that will be held at the posyandu. This application is designed with operating system limits or android version 5.1 (Lollipop).

This application can input health data, provide information about health, and schedule activities to be carried out at the posyandu. Later the data will be displayed on the user side, making it easier for users to get health information and activities to be carried out
