

ABSTRACT

The world of hobbies in Indonesia is very rapidly developing today. His own hobbies vary, one of the most popular hobby types is collecting. The hobby of collecting also has a variety of types, one of which is collecting toys. Starting from the hobby of collecting this toy can create a large community, one of the Lego toy collector communities. Along with this, various communities and fans collecting this lego toys in Indonesia are very large. Judging from community data that already has many members who are widespread in Indonesia. Forming a community is one of the collectors to expand business networks too. The status of this community has been officially recognized by Lego Group from Denmark. However, a problem was found, namely with the official status of this community, there are no special facilities for the exhibition area of the community work gallery and the Lego Indonesia community center itself. Therefore, the problem becomes a logical thing to design. Not only to facilitate the Community, but also to provide a special space for galleries of works from the community which so far have not had a special forum and as a place for discussion, seeking knowledge, and fostering relationships with fellow Lego lovers community and the community. It is hoped that with this Planning and Design, people's interest in this hobby with Lego will increase and become a new recreational facility, especially for the Jakarta area.
