

ABSTRACT

A company is an institution that provides goods and services that have the aim of obtaining a profit. In achieving these benefits there are goods and services offered. Especially in the provision of goods in the process is needed. This process needs to be monitored and recorded every step of the way, so that no one is left behind. In addition, with the recording of this step, it can track the whereabouts of the goods that have been ordered.

On this website, each position of the goods processor has one account where later if someone logs in, it will determine the position where the goods are located. Each order of goods will be entered into the website and will create a QR-Code as a unique code for each order. Later, if you want to see the presence of goods, you can see it on the dashboard.

So this web can make it easier to see the presence of orders. And can recap the data, because every data on the results of the order will be stored on the dashboard menu. With these problems, the solution that can be provided is in the form of creating a web-based goods packaging tracking system. After creating this item packaging tracking system, the system can input data, track data with a QR-code or invoice code, and store the data that has been inputted. Based on the alpha and beta tests that have been carried out, the system can run well and after conducting a survey on the company also got an overall score of 83% with the caption "strongly agree".

Kata Kunci: *Tracking, Website, QR Code.*
