

ABSTRACT

The Public Works Office is an administrative office that handles regional and state infrastructure. The Public Works Office oversees various fields, from residential areas to government buildings to the procurement of roads and public facilities to facilitate the community in carrying out their work. The design of government offices must be adjusted to the standards set out in the presidential regulation of the Republic of Indonesia number 73 of 2011. As an agency that handles infrastructure, the Public Works Office is a center for designing many buildings from other government services. So this design aims to provide a design concept that is more effective and in accordance with the standards of the President's regulations. In collecting design data, the method used is observations made at the Office of Public Works located in Bulungan Regency, North Kalimantan province, interviews conducted in various fields within the Office of Public Works, Another method is documentation related to the existing condition of the building from the Office of Public Works Office, comparative study method is carried out by comparing the existing office with two other Public Works Offices, namely the North Kalimantan PIP2B office and the East Kalimantan Public Works Office, and the last method is a literature study by collecting design standard literature. This office applies a green design approach. Green design is a design using a design approach aimed at creating a healthy building by suppressing the use of excess energy and the use of natural materials. With the current existing conditions, it is very necessary to redesign the building in order to meet the standards.
