

ABSTRACT

Donors are people who make donations in the form of money or goods voluntarily to an association and the like, such as to victims of natural disasters and people who need assistance. Therefore, here the author will take the title Web-Based Natural Disaster Donation Fundraising Application with a Donor Module which explains how donors make donations to people affected by natural disasters through the application. The working method used in this study is a software development method using the waterfall method. In making the software using the CodeIgniter Framework which is used to create a web-based application that is compiled using the PHP programming language and a database using MySQL. In the initial stage, the user who accesses this program will be given the initial system page in the form of an account list page display, login, after that the user can access everything on the web such as the homepage, donation history and others.
