

ABSTRACT

NEW DESIGN OF INTERIOR HILTON HOTEL RESORTIN LEMBANG WITH HEALING ENVIRONMENT APPROACH

During the Covid-19 pandemic, the level of stress in the community increased and tourist objects were reopened as a medium of relaxation. Resort hotels that blend with nature become one of the supporting facilities for the wellness program. The area of Lembang, Bandung with high natural potential does not yet have a resort hotel type that supports the healing process with natural offerings in its area. This attraction will be a boon for Hilton brand. However, some discrepancies such as visual concepts that do not support the healing process, uncertain circulation, and inconsistent facilities are still found in the observations. Therefore, the purpose of this design is to present a calming interior atmosphere and stimulate a sense of happiness, directed circulation to facilitate the movement of visitors to access the available facilities, and create facilities that are consistent in helping the healing process. In the introductory report of this final project, qualitative methods are used with data collection through interviews, questionnaires, literature studies and comparative studies regarding the design of resort hotels with a healing environment approach along with thermal comfort of villa visitors in the Lembang area. The collected results will be analyzed and designed with the concept of sensory processing into the form of technical working drawings and presentations, 3D visuals, as well as animations. In the results of this design, a general plan is made in the form of the main hotel building and wellness center along with a special plan consisting of the lobby, guest rooms, villas, restaurant villa, and spa. From the results of this design, it is hoped that the factors that affect the healing process at the resort hotel can be fulfilled as a choice of accommodation for wellness destinations in Lembang.
