

ABSTRACT

The development of this technology is very rapid, especially in the field of information systems, this is due to the increasing human need for fast and accurate information. Data recording carried out by Ahadiat Hotels and Bungalows is still manual, companies in the hospitality sector have begun to develop their administrative systems using web-based applications developed at Ahadiat Hotels and Bungalows, the system manages room reservation data and check-in. The hotel room reservation information system is built with a programming language as a tool to help manage databases using PHP and MySQL. The hotel room reservation information system can make it easy for hotel customers to make room reservations, besides that visitors can also get all information on facilities and news at Ahadiat Hotels and Bungalows.
