

ABSTRACT

The movement of people from one place to another is something that is often found in the community. Even in everyday life is also often encountered. Population mobility is not always permanent in a certain area, usually they will look for the most comfortable place according to him. Rest Area is a place and facilities provided for road users so that drivers, passengers and vehicles can rest for a while due to fatigue. De Ngaso is one of the Rest Areas and family tourist attractions located in Soreang, Bandung Regency, West Java. Over time, developments in the development of tourism areas will have an impact on the number of conflicts that arise regarding the issue of environmental damage. Based on the issues that have been mentioned, the biophilic approach can be a solution to the existing problems. This approach will be applied to the design of the rest area building while still paying attention to environmental sustainability and an environmentally friendly design. Therefore, fwwe need an area that provides various types of facilities that can meet the needs of motorists or visitors as a place to rest so that they can travel safely to their destination.

Keywords: Rest Area, Biophilic, Population Mobility
