

ABSTRACT

Chawaa Cafe is a cafe business that provides Food and Beverage services. At the time of compiling this report, almost all recording activities in Chawaa Cafe's operations were carried out manually. In an interview with the manager of Chawaa Cafe, various problems were found in the implementation of its business operations, one of which was in financial records. Problems with these financial records include discrepancies in the amount of money recorded, poor quality of financial reports, as well as several other problems caused by these problems. Therefore, Chawaa Cafe became the research subject of this Final Project. In this research, an integrated application system design is proposed which contains the Point of Sales, Warehouse Management, and Accounting Information System modules. However, this report will only focus on discussing the design of the integrated Accounting Information System module. The purpose of this research is to provide digital solutions to overcome the problems that exist in Chawaa Cafe through an integrated Accounting Information System. The web-based application is built using the Laravel framework using the Rapid Application Development application development methodology and the Black-box Testing application testing method. The research ends by producing an application that meets the needs of Chawaa Cafe after testing the staff and managers at Chawaa Cafe.

Keyword: Accounting Information System, Rapid Application Development, web.
