A person's mental or psychological condition is very influential in his or her activities. Even the people who are active inside the hospital, both medical personnel who need high concentration while performing chores and patients who are in pain. A stable mental condition and calm feelings can help everyone to activity inside the hospital in order to create well-run activities.

The method of this new interior design was followed by observation to obtain physical data of a space, size and facility in a building that matched the standard of hospital design and was able to obtain non-physical data obtained from interviews with hospital management. Data's already being used as an analysis of all the needs in the design.

The new design of the interior of simatupang hospital will use a biophilic approach on "Health With Nature" thus creating an interior design that gives users peace and comfort especially medical workers and patients who want/are receiving treatment and can have a positive effect on user psychology.

Keywords: Hospital, Hospital Design, Biophilic.
