ABSTRACT

Buses are a common form of public transit in cities because of their enormous carrying capacities.Each destination is frequently served by many bus lines.Bus passengers frequently complain about the difficulties of determining the bus's location and the bus's delay in arriving at its destination.Previous studies have looked at this bus, but we are unable to provide information on bus locations or arrival and delay times.As a result, technology was used to create a web-based GPS-based travel tracking and surveillance system.In public transportation, such as buses, GPS is employed.It's a way to track the whereabouts of buses that people desire to take, and it may be used for surveillance over the internet.service
