

Makassar is one of the metropolitan cities that is ranked 5th in Indonesia. The degree of public health in Indonesia continues to increase and people must also obtain services in the health sector equally. Therefore, it is necessary to have a hospital design that is in accordance with hospital design regulations and meets standards. Hospitals are closely related to patient healing, but hospital designs often prioritize healing from a physical point of view only so that they pay less attention from a psychic and psychological point of view, making patients feel restless and uncomfortable because the atmosphere that is caused seems tense. Physical healing is carried out by maximizing the use of space for patient health services and the lack of space for patient interaction with the natural environment. The implementation of psychic and psychological healing is carried out by providing mediators of a natural nature. For example, Bhayangkara Hospital Makassar. Basically, humans tend to be able to relate to nature which can have a positive impact both psychologically and physically. The biophilic design approach in hospital design has now begun to be applied to several hospitals, this is because biophilic design provides an environmentally friendly hospital atmosphere and in accordance with hospital construction standards. Through the concept of biophilic design, it is hoped that it can present opportunities for humans to live and work in a healthy place, minimal stress levels, and provide a prosperous life by synergizing design with nature.

The patient's health is not only physical, but also psychically. By applying the biophilic design concept, it will bring a sense of security and comfort in the patient. Examples of the application of the concept of biophilic design through water elements, namely fountains, ponds, and aquariums. In addition, it can also be applied in the form of paintings that visualize natural scenery, as well as color synergies in the interior and exterior that can be applied to the hospital environment. This concept can be maximized in the rehabilitation or inpatient department as well as the park around the hospital. In order to increase the spirit and positive energy of the environment and support from people around who are undergoing the healing process, the use of the biophilic design concept in this hospital is expected to make this happen.
