ABSTRACT

Fruit and vegetables are food consumption that are often purchased by the community to meet the nutritional needs of the body, but prices that always change over time and high price differences between traders are common problems that occur in the sale and purchase of fruits and vegetables. With the development of information technology, the media to monitor the development of fruit and vegetable prices is also developing. One of the perceived impacts is that it is easier for humans to access fruit and vegetable price information whenever needed. To overcome this problem, a Fruit and Vegetable Price Monitoring application was built which can be a forum for sharing information between traders and potential buyers.
