

ABSTRACT

SILINDA or the Regional Inflation Control Information System originated from the anxiety experienced by the Regional Inflation Control Team (TPID) and the West Java Economic Bureau who collaborated with Bank Indonesia for the West Java region by monitoring price data for several commodities throughout West Java region so an application called SILINDA was made which was done using the Agile method. This application can make it easier to monitor price data for several commodities throughout West Java and can eliminate food price information asymmetry between regions in West Java. In developing this application, a product owner is needed to carry out documentation such as making a specification document and a bug report document which are used as a reference by engineers in developing applications. As well as application testing is needed to ensure the quality of the application while in the maintenance phase and change request.
