ABSTRACT

Technology is the most essential thing in today's digital era, as well as technological developments in the government sector which are facilitated directly to facilitate the people. One is the OSS-RBA system, an integrated electronic system managed and organized by the Ministry of Investment / BKPM for business actors to facilitate business licensing. The development of this technology is not just an ordinary asset but involves many ministries and institutions under it in the development process. Of course, the large scale of technology development does not rule out the possibility of errors in the software being built in the future, therefore a quality test is needed on the product to avoid defects or even errors that are not by the initial regulations. In a test, a method and standard are also needed to measure a limit and how to test in software, in the development of this technology, a method in the form of black box testing is used by testing software to find out input and output without knowing the structure and code in the software until it becomes a product.
