Emergency Installation is an installation that offers fast, precise and thorough services. The phenomenon of emergency departments experiencing overcrowding due to diseases caused by an increasingly advanced lifestyle in society is something that must be considered, that this phenomenon must be followed by the provision of an appropriate place or container so that health services can be realized as they should. Presenting an Emergency Room that is maximal in its spatial arrangement, space requirements and visualization will solve problems in the Emergency Room related to services and negative suggestions such as panic. In Emergency Installation Design using the Human Behavior Approach, it can analyze behaviors that are created and usually occur in Emergency Installations so that they can help carry out health service activities in Emergency Installations, namely Fast, Precise and Careful.
