

## **ABSTRACT**

Cafeasy is purposed for all café in Bandung city as an application to help the customer in online ordering while in a café. Also cafeasy provide an automated bookkeeping feature that is integrated into the inventory data which would be used by the café staff or café owner. Because this application was just developed now, therefore needed testing to ensure the code works as it is designed and not doing what we don't want. Some of the testing types that can be implemented in Cafeasy are integration testing, performance testing and User Acceptance Testing. Moreover, during the development phase would be using the Agile Scrum method which at the very end of every sprint there's testing based on the finished implementing of the product backlog. The results of those three testings are that every page in the application customer side has been integrated as per the specification. The performance of the application needs to be improved and based on UAT the application is very acceptable by the user.

**Keyword:** Cafeasy, Web Application, Software Testing, Integration Testing, Performance Testing, User Acceptance Testing
