## ABSTRACT

RSUD Kota Bogor Type B is a government healthcare facility that serves as a referral hospital in its region. Covering a building area of approximately 82,000 m<sup>2</sup>, it encompasses various medical facilities, including outpatient clinics that cater to the healthcare needs of the community without requiring hospitalization. Given the discovery of various psychological issues related to perception patterns and the public's perspective, a design concept utilizing an environmental recovery approach is employed, with a focus on family environment, social surroundings, and nature.

Aligned with hospital standardization policies, it is anticipated that this approach will enhance the quality of human resources to improve service delivery and stimulate patient recovery throughout their treatment journey
