

ABSTRACT

According to Rahmawati et al. (2018), many companies currently use hybrid systems to support the flexibility of workers. Thus, it can reduce productivity in the work area. Because hybrid workers have a high level of mobility, they need special facilities to facilitate mobility while working. This design uses a qualitative method with the Scamper approach to produce a prototype that can meet consumer needs. The purpose of this design is to increase the comfort and productivity of the working space by using ergonomic aspects. For the above reasons, the researcher chose to redesign a desk organizer portable to support the mobility of hybrid workers.
