ABSTRACT

This research aims to develop a web-based application for managing bound and unbound infaq at LAZISSU. Restricted and unrestricted donations are donations made by Muslims to help with religious and social activities. However, much of the infaq management is still done manually and is not well structured. The research method used is system development using the Waterfall method. Development stages include requirements analysis, system design, implementation, testing and maintenance. In the system design process using BPMN, Use Case Diagrams, and Entity Relationship Diagrams. This application uses MySQL as a database manager. This application was created using the PHP programming language and blackbox testing for testing methods. It is hoped that with this web-based application, the management of bound and unbound infaq can be done in a more structured and efficient manner. Apart from that, this application can help minimize data input errors and produce accurate financial reports.
