Kampung Rajut in Binong Jati sub-district, Batununggal district, apart from producing knitting products, the tourism village also produces waste in the form of knitting yarn. In previous research, knitting yarn waste treatment was carried out by adding black dye so that there was no choice of yarn based on color. Evaluation of the results of previous research products was used as a problem in this study that the trend forecast on the design of processed yarn waste products had not been applied and variations in yarn design designs varied less. So in this study resulted formulation of the design variation and concept of fashion accessories products that apply trend forecasting to the manufacture of fashion accessory product prototypes.

Keywords: waste treatment, yarn, tapestry technique
