

ABSTRACT

Hospitals in Indonesia, including the Mother and Child Hospital BUN in Tangerang Regency, have not fully considered interior design that influences the patient healing process. Environmental factors play a crucial role in healing, surpassing medical factors. The population in Tangerang Regency continues to increase, yet issues of maternal and infant mortality and morbidity remain significant. The interior design of hospitals falls short of standards and needs to prioritize patient comfort. The design concept for the Mother and Child Hospital BUN revolves around the theme "Fresh Healthy Family," employing a healing environment approach with a focus on the well-being of mothers and children. A favorable physical environment expedites recovery and alleviates patient stress. The objective is to establish a hospital setting that supports the physical, emotional, and psychological recovery of patients, particularly mothers and children. This design avoids deficiencies in facilities and interior elements that could affect patient mood, thereby creating a comfortable atmosphere within the hospital's premises.
