

ABSTRACT

The Minister of Communication and Information of the Republic of Indonesia built the Telecommunication Equipment Testing Scale (BBPPT) in Depok City with the aim of reviewing radio equipment and devices used by the public so that they meet standards. The purpose of establishing a test site for telecommunication equipment is to ensure that the equipment meets national and international consumer protection standards. In addition, to increase competency in human resource development and trial tools.

The BBPPT Kominfo building, which was previously located at Bintara, had deficiencies in its interior, especially not having implemented government standards. The lack of interior can affect the productivity of Kominfo employees who are working. Therefore, Kominfo wants to build a BBPPT Kominfo building in Depok that can meet the needs of Kominfo employees and their interior needs in workspaces and laboratories by implementing the standards of Minister of Communication and Informatics Regulation Number 04/PER/M.KOMINFO/03/2011. A good workspace will create comfort for users.
