

ABSTRACT

Web-Based Application Procurement Application is an application that contains information on the stock of raw materials in CV Ernov Bali's garments. This application takes a case study at CV Ernov Bali's garment. In this garment there is a problem related to raw materials, for example the frequent delays in the operations of the leather raw material manufacturing industry and other raw materials due to the absence of a raw material management system, where errors often occur in the management of raw material data on garments, due to still using a manual system. This application was built to assist procurement staff and procurement managers in making reports on incoming raw materials and outgoing raw materials as well as the amount of stock available in garments. The use of this application uses the Waterfall method and uses the PHP Framework CodeIgniter programming language and MySQL database. The results of this application can assist procurement staff and procurement managers in knowing the stock of available raw materials and making reports in and out of materials on garments.

Keywords: Procurement of Raw Materials, Applications, CodeIgniter.
