

ABSTRACT

The rapid development of information technology has penetrated many fields, including the health sector. Information technology can handle data and process it into information, information technology can store data, with a large total volume. Information technology also allows health information to be sent online easily and quickly. development of information technology to support more effective and efficient medical management. The Tambling Health Center is one of the health centers that have a strategic position close to the Bandung city square which allows many patients to seek treatment there. To overcome this problem, it is necessary to develop a system with a faster rate of calculation and data delivery, capable of working quickly and more accurately. This system can help officers speed up and simplify the process of managing patient data and reduce queues for outpatients. By using a manual system the time required for long patient registration and long queues. The target to be achieved for this proposal is to be able to advance the Tambling health center with advances in information technology.
