

## ABSTRACT

---

*In an effort to enhance the quality and human resources for the future, students, as agents of change, possess significant potential to improve themselves. One way to optimize this potential is through participation in competitions, particularly for students in the D3 Information Systems program. Engaging in competitions not only offers benefits in terms of skill improvement, but also enhances soft skills, provides valuable experiences, expands networks, and offers opportunities to win prizes and obtain certificates. Despite the availability of competition information on internet search engines, there are often challenges such as encountering invalid information and missing registration deadlines. Based on a survey conducted among students in the D3 Information Systems program, it was found that 80% of the respondents obtain competition information from WhatsApp groups, while the remaining 20% rely on search engines and social media. Therefore, there is a need for an information and competition reporting platform that classifies web pages, ensuring that students can access valid information regarding the competitions being held.*
