

ABSTRACT

Consumption of free-range chickens has increased from year to year. This is a good opportunity for companies that raise free-range chickens such as Mitra Poultry Sonofera Farm. Doc or chick seeds are one of the products sold by Mitra Poultry Sonofera Farm which is produced from eggs that are deliberately hatched. Mitra Poultry SonoFera Farm's financial records are still carried out conventionally so that the balance held by the farmer is not recorded accurately. This final project aims to make it easier for SonoFera Farm Poultry Partners to manage the administrative process so that financial reports are clear. This application uses the PHP programming language and the CodeIgniter 4 framework with MySQL for database storage. This application was tested using the Black Box testing method and resulted in the conclusion that the application can manage and record the transactions required at SonoFera Farm Poultry Partners well.
