

## ABSTRACT

*Cancer is the 2nd deadly disease in the world where in Indonesia there are 877,531 cases and there are around 209,236 children diagnosed with cancer in 2023. This happens because more than 50% of cancer cases in children come to health facilities in an advanced stage, due to the factor that the majority of pediatric cancer hospitals are in big cities like Jakarta, so it requires a large amount of money for treatment. A halfway house is a facility specifically designed to create a comfortable and safe place to stay, providing emotional, social, spiritual support to children and caregivers of patients who are undergoing cancer treatment outside the city without any costs that need to be incurred by the family. Palliative care is an approach that is carried out with the aim of improving the quality of life of patients and families in dealing with problems related to life-threatening diseases which are generally aimed at patients with high mortality rates, one of which is cancer. YKAKI or Yayasan Kasih Anak Kanker Indonesia is a children's cancer shelter that has been present in Indonesia since 2006, related to the interior conditions of YKAKI Jakarta there are several problems in it, ranging from problems of psychological comfort, health, and the existence of facilities that can be developed. The purpose of the new interior design of this halfway house is to help the patient's recovery process by applying a palliative approach in interior aspects, increasing facility needs, providing a comfortable, calm, and optimistic space atmosphere by applying natural elements in it. This new interior design is based on research by conducting literature studies, field surveys, and interviews. This design is expected to open the views of interior designers that the halfway house is not only a temporary residence, but the interior of the halfway house can provide a role to help the healing process of the residents.*
