ABSTRACT

Rumah Mama Pharmacy is a place to sell various kinds of medicines. Mama's House Pharmacy has business processes such as purchasing and sales. This business process often creates various problems, such as not recording the results of buying and selling drugs. Currently, all transaction processes are carried out manually or still use books to record all purchase and sales transactions, so pharmacy owners have to collect proof of receipts to re-record them. It is hoped that this drug purchase and sale transaction application can be a solution to the problems that exist in this pharmacy. The purpose of this application is to provide features for managing drug purchase and drug sales transactions, as well as profit and loss reports at Mama's home pharmacy. In developing this application, the PHP programming language is used and for the database, MySQL is used. Meanwhile, the method used in this application is the Waterfall method. From the test results, it is hoped that it can fulfill the objectives of creating a buying and selling application at the Rumah Mama pharmacy.
