ABSTRACT

Technology has become essential for solving various problems quickly and accurately. Operational efficiency and quality service are crucial in dental practice. However, daily issues in many dental clinics can affect productivity, service quality, and patient experience. Common problems include inefficient work processes, poor schedule management, and administrative records still being handled manually. These issues include the lengthy search for patient profiles, ineffective clinic revenue reporting, and errors in recording treatment costs. To address these problems, a dental clinic management software system is needed to improve service quality, facilitate the organization of patient data, manage online reservations, and report clinic revenue efficiently and effectively. This system should also help patients register and obtain important information about dental care.
