ABSTRACT

Toko Usaha Baru is a small and medium-sized enterprise (SME) that markets food, beverages, daily necessities. Currently, its financial management lacks a structured system. Therefore, a web-based application is being developed using the Laravel Framework and SQL Server database. The development process utilizes structured methods such as Unified Modelling Language (UML) and Entity Relationship Diagram (ERD). The process involves requirements analysis, system design, implementation, and testing to ensure that the application meets the store's needs. This application is designed to manage inventory, record sales transactions, and generate reports, general ledgers, and financial statements. The main objective of this application is to enhance the accuracy and efficiency of financial and operational management within the store. With this Point of Sales (POS) information system, cashiers will be able to perform their tasks more efficiently.

Keywords: Point of Sales (POS), Web-Based Application, Sales.
