
LIST OF FIGURES

2.1	The architecture of the 1D CNN used in this study.	7
2.2	The Structure of Attention Mechanism.	9
3.1	Flowchart of the overall structure of the models.	13
3.2	Location selected for weather data analysis in East Java, Indonesia. The map features markers for key cities, i.e., Sumenep (red), Surabaya (purple), Babadan (green), and Sempol (blue).	14
3.3	Electricity load data for the East Java area from 2021 to May 2023. The plot shows the electricity load (MW) over time with highlighted background colors indicating different holiday periods: Public Holidays (orange), New Year (blue), and Eid celebrations (green). Each holiday period is represented with a semi-transparent background to provide context on how these events impact electricity consumption.	15
3.4	Distribution of electricity load across different times. (a) Boxplot showing the distribution of electricity load for each hour of the day. (b) Boxplot displaying the distribution of electricity load for each day of the week. . . .	15
3.5	Comparison of electricity load with weather parameters in Babadan. The red line depicts the electricity load (MW), while the blue dashed lines represent different weather variables: SSRD, T2M, V10, D2M, U10, and TP. The x-axis covers the period [month, years].	17
3.6	Results of signal decomposition using EMD. The electricity load signal has been decomposed into several IMFs labeled IMF 1 to IMF 12, and residue. The x-axis covers the period [month, years].	20
3.7	The CC between the IMFs and the electricity load signal. The bar plot indicates that IMF-3 has the highest correlation with the electricity load, followed by IMF-6 and IMF-7. IMFs with the three highest CC are shown in red, while the others are shown in blue.	21
3.8	Distribution of Training, Validation, and Testing Sets for Electricity Load Data.	22
4.1	Plotting training data, validation data, test data, and CNN model predictions	24
4.2	Electricity load forecasting results using CNN. The red line denotes the electricity load, while the blue dashed line represents the CNN models. . . .	24
4.3	Plotting training and validation loss CNN.	25
4.4	Plotting training data, validation data, test data, and CNN with Attention Mechanism	26

4.5	Electricity load forecasting results using CNN with Attention Mechanism. The red line denotes the electricity load, while the blue dashed line represents the CNN with AM models.	26
4.6	Plotting training and validation loss CNN with AM.	27
4.7	Plotting training data, validation data, test data, and CNN with Attention Mechanism and EMD	28
4.8	Electricity load forecasting results using CNN with Attention Mechanism and EMD. The red line denotes the electricity load, while the blue dashed line represents the CNN AM with EMD models.	29
4.9	Plotting training and validation loss CNN with AM and EMD.	29
4.10	Comparison of forecasting results among the proposed hybrid models. The dashed black line denotes the actual electricity load. The dotted green line represents the predictions from the CNN models. The dashed blue line shows the predictions from the CNN models with Attention Mechanism. The solid red line illustrates the predictions from the CNN models with both Attention Mechanism and EMD.	31
