

ABSTRACT

Puskesmas Condong is a community health center with a middle-level or Madya accreditation. The design of Puskesmas Condong aims to improve the infrastructure aspects of the health facility, in order to enhance the quality of health services, provide more comfort for building users, and improve the health center's accreditation. Puskesmas Condong faces main issues in zoning, circulation, ventilation, facility standards, material standards, and visual concepts. In response to these issues and goals, this design is created with the theme "comfortably efficient" to make the health center both efficient and comfortable. The design includes adding several spaces that are not yet up to standard, rearranging the layout, designing a sterile and optimal ventilation system, and redesigning the visual concept. With this design, the spaces in the health center will become more comfortable for users and more efficient in supporting activities.
