

REDESIGNING THE INTERIOR OF PACITAN TYPE A BUS TERMINAL WITH APPROACH OF ACCESSIBILITY

ABSTRACT

The design of the Pacitan Terminal represents an initiative in an effort to improve terminal facilities and services in Pacitan Regency. The design of the terminal, which is included in the category of Class 3 Type A Bus Terminal, involves updating and improving various aspects, including the restoration of space functions, the fulfillment of accessibility needs, and the design of communication facilities. The function of the room aims to align the terminal with the various needs of users, including terminal service unit offices, waiting rooms, and other supporting facilities. The waiting room is planned according to interior standards which aims to create a comfortable and aesthetic environment. In addition, the management of informative communication facilities will help users to easily obtain information through the integration of signage and wayfinding systems.

The redesign of the Pacitan Terminal has great urgency because this terminal functions as the main gateway for Pacitan residents and visitors to various destinations inside and outside the city. Efforts to improve facilities and design a better communication system are expected to improve the user experience by supporting accessibility for every group.
