

ABSTRACT

AWH MiniCafe is one of the products produced by PT Adhikari Innovation Indonesia, which is located at Jl. Main Boulevard, Rancabolang, Bandung City, West Java. AWH MiniCafe provides food and drinks such as coffee, ice cream, mini burgers, toast, spaghetti and others. The problem faced by AWH MiniCafe is that the transaction process starting from calculations and recording is still manual and it is not uncommon to experience errors in calculations or errors in recording raw material inventory. In order to improve recording accuracy, the author aims to create a web-based application. This application includes recording purchase transactions, raw material usage and producing raw material stock list reports and general journals. This application was built using the PHP (Hypertext Preprocessor) programming language with the Laravel framework and the MySQL (My Structured Query Language) query language. It is hoped that this application can help optimize business management and create more accurate reports.
