

REDESIGNING THE BANDUNG TECHNO PARK BUILDING WITH THE APPLICATION OF INTERIOR HEALTH AND COMFORT (IHC)

ABSTRACT

Bandung was designated as a creative city of the world by UNESCO in 2015, further strengthening Bandung as a center of innovation and creative industry in Indonesia. Its strong entrepreneurial atmosphere has led to the emergence of many startups. The growth of these startups needs to be supported by facilities such as coworking spaces. Bandung Techno Park plays a role in providing coworking space facilities. In this study, three methods were used to collect data: observation or surveys, literature studies, and interviews to identify the issues at BTP in order to improve comfort and meet facility needs. The implementation of interior health and comfort aims to enhance the health and comfort of its users.
