

ABSTRACT

Toko Thifa is a microbusiness engaged in the trade of various school uniform attributes, agency emblems, and administrative supplies in the city of Pariaman. In its operational activities, this store faces challenges in managing purchases and sales because they are still done manually using paper media, which is prone to getting lost and damaged. To address these issues, this final project aims to build a web-based application capable of managing the purchase and sale of merchandise, as well as displaying general journals, ledgers, purchase reports, sales reports, and stock reports. This application is developed using the Software Development Life Cycle (SDLC) waterfall model, with the PHP programming language in the Laravel Framework and a MySQL database. Testing is conducted using the Black Box Testing method to ensure the system operates according to requirements. This application can manage purchases, sales, as well as generate general journals, ledgers, purchase reports, sales reports, and stock reports.
