

ABSTRACT

Hikari Bridge is a training institution located at Ruko Dewadaru Residence Number R-4, Jalan Cikoneng, Lengkong, Bojongsoang District, Bandung Regency, West Java. The registration and input of students as well as student attendance reports are still conducted using an application, which often leads to data entry or student registration errors. This final project develops an application for student registration, attendance, and recording of student income that functions to manage registrations based on students who apply and manage student attendance data as well as income records at the training institution. This application is built with the PHP programming language and uses the Laravel framework and MySQL as the database server. This application manages registrations with students who wish to register and student attendance reports as well as the recording of student income managed by registration staff and teachers. The author creates an application that makes it easy for students to register, pay tuition fees, and this application facilitates staff in recording income up to the income reports which can be recorded and printed. For teachers, it also generates an application that makes it easier to take student attendance online.
