

Abstract

Attack XSRF used to exploit the security gap of application web. This attack cause the trouble of system performance and data security.

To prevent the attack XSRF require the analysis of the attack mechanism. The most important need is looking for the weakness of application system and how to improve that weakness. So that needed by evaluation to existing security system and make the new device capable to prevent the attack XSRF.

Token Identifier is functioning token identify to every action at application as part of verification process. Token Identifier created because requirement of attack prevention of XSRF. Token Identifier can be made with the security system modification.

Keywords: XSRF attack, token identifier
