

## ABSTRACT

Web Programming is a web-based programming technology is very good if collaborated with the database to create an online-based information system which offers increased efficiency in the mobility of a user. PHP, HTML, MySQL is a web programming language that is currently the most widely favored to realize a web information system because of their ruggedness and also open source. Web-based information systems offer a superior quality improvement systems for workflow and employee records, and facilitate monitoring by the owner to monitor the condition of the company wherever located through the Internet.

The purpose of this Final Project is to create an information system in the field of production, warehouse, sales, and web-based accounting to facilitate the recording and management workers in the work and simplify the company's owner check reports directly through the Internet wherever they may be. Programming languages used are PHP, HTML, MySQL mutually integrated and run on an Apache web server or a web hosting on the internet.

At the end of this project has created an information system that provides ease in the recording process of production, warehouse / inventory, sales, and accounting, so that all data can be processed into a report that realtime and can be opened by the owner anywhere via the Internet network.

Kata Kunci : *PHP, MySQL, HTML, Database, Information Systems*
