

ABSTRACT

Trading activity in life is definitely going to be done by each individual human being. Furthermore, with the times which exist, require man to follow the trend. Limitations of time and effort a person to be one factor that can not be released at this time. Buying and selling online is one solution for those who always wanted to continue to update information on goods that exist.

Seeing the effectiveness of buying and selling is done online, there is an idea to create an online trading application on the mobile phone. This application is named "Online Sales System Using Java-Based System Android 2.1". This application is applied to the Android-based mobile system based on predictions for the world mobile phone market, android will occupy the top position of mobile phone sales, so most likely everyone has a mobile phone-based Android operating system is. Android 2.1 operating system is the easiest thing to do application development, so that the application is made with a system-based operating system android android 2.1

This application is created with the aim to facilitate the user in making purchases of goods so that the user does not need to come directly to the store to trade, enough to activate this application on the phone then the transaction can be directly run. 85% of correspondents said that this application is quite useful and has a very interesting, so this application could be to use.
