

ABSTRACT

In this era of globalization are so many people are using technology to meet their needs. It can not be denied that the need for current technology is very high, also in the school environment. Most public schools do not have any academic information system-based website that can be known by the public.

This final project created a CMS-based website that uses PHP to be used as user interface and MySQL as the database along with the admission of new students based sms gateways, and other supporting features. The website is designed to assist people in finding academic information, new admissions, and the profile of this school, which will be implemented on the website academic information of SMPN 3 Lembang.

The final result of making this *Academic Information Website of SMPN 3 Lembang and PPDB Online System Using SMS Gateway* is to facilitate society and alumni in finding information as well as to facilitate the school to provide information. Then this website can be beneficial to the school, alumni and the society.

Keywords: *website*, CMS, SMS Gateway, PHP, MySQL
