

Abstract

TK Al-Muhajirin is a kindergarten under the auspices of DKM Al-Muhajirin. School is located in Jalan Suryalaya Baru B 15 Buah Batu Bandung. This school is experiencing a phase of development, ranging from schools to the level of A and B only, but now began to expand into the playgroup program. So that the number of students is increasing and so is the data to be managed.

Therefore it is necessary to have an application that is capable of managing the data, because until now, the schools were using manual systems to manage data, as well as financial management. With the management application, the administration expected to be able to assist and facilitate the school in the database creation process, the calculation of salaries, preparation of financial statements, and financial management processes.

Financial administration application is an information system that can help overcome the problem of school financial management, including management of income, expenses, and budgets. With this application, the foundation and principals can easily find out the change of school finance, financial position, and facilitate the TU staff in controlling expenditure against budgets. So that expenditure does not exceed the budget.

To support these functions, a stand alone applications will be built with structured programming techniques, using the Delphi programming language, MySQL database, a report using the Quick Report and other supporting applications.

Keywords: finance, budget, Delphi, MySQL, Quick Report
