BKM Al Amin is a shop selling the business wrestle daily necessities needed by students in the campus IT Telkom. Like, stationery, books, food, etc. The store has several business processes in the processing of data, either data or sales data of purchase. Until now, the data processing still using manual system that has not been computerized and the data storage is still scattered and not well documented. Where in the data processing still using Microsoft Excel and Microsoft Word, do not have a database as data storage media.

With abstraction based on the above, has built a sales application. This application not only handle sales, but also handles the supply of goods. The data will be stored into the database making it easier for employees who will see it. Also this application can also help employees see the report in tabular form as well.

This application is based on the analysis and design with the waterfall method. Software development method using object-oriented programming. Java will be used as a programming language and MySQL will be used as a database processor
