

Abstract

Computer is one of component that never rid of human dailly activities. Most of the people spent their whole time in front of computer. They are doing their activities, like working, playing, studying and etc. They are wasting their time because unarrange schedulle.

Alarm is thing that used for alert something. Most of alarm produce a loudly voice or brightly light, and the other use different method to atract human attention. there are many desktop aplication that have a function for alarm, but because of complicated functionality and the rigid design, most of people never used it. the other reason is, because people want to choose the cuztomizable application.

Java is one of the trade language progamming, that used by most progammer right now. Because of one characteristic, portability, that make the aplication that use java language can be installed in any Operating System.

Therefor, this final project "Application Alarm Desktop Notification With Java" is made to reduce the other constraint.By using this application, hopefully people can arrange their shedull activity.

this final project made with Java Language, Netbeans 6.8 adapted all of package, package jCalendar, and the other tools.

Keyword : *alarm, java*
