ABSTRACT

Presentation is an activity aimed at tell idea to audience. A good presentation is when the message can be received by audience. Nowadays the presenter still use an simple way to control an presentation slide by use keyboard or mouse. This case result in less interaction between presenter and audience and disturb concentrations of audience because presenter have to control the presentation slide on the computer.

A tool that can help presenter to control presentation a little is laser presentation remote. But that tool only can control slide sequentially and point some area on slide. Presenter also can use assistant but still have many constraints for example a miss coordination, the issue of fleksibility and less privacy of presentation.

Based on those requirements, PRENDROID-an application that can help presenter to control presentation slide by android devise- was built. On those application, user can look on the way presentation slide on android device. Movement of presentation slide can be done in android device too. There are some other features wich all of them are done in android device, they are jump to page to move slide choosen, play some multimedia such as music and video, open some kind of link such as another slide page, web page, and another file too, pen feature to make annotation on slide, and magnify feature to use magnifier on presentation screen.
